

Question:
Nine of the kids in Gina's class are allergic to dairy, 6 are allergic to peanuts and 3 are allergic to both. If there are 32 kids in her class, how many aren't allergic to anything?

Reasoning + Answer:

<think>
There are 9 kids with dairy allergies
There are 6 kids with peanut allergies
3 kids are with both
That leaves $9 + 6 - 3 = 12$ with allergies
Since there are 32 total kids in class
That leaves $32 - 12 = 20$ that are not allergic to anything
So 20 are not allergic to anything
</think>
< answer >
20
</answer>
