

Question:

Debra is monitoring a beehive to see how many bees come and go in a day. She sees 30 bees leave the hive in the first 6 hours, and then she sees 1/2 that many bees return in the next 6 hours. She sees two times as many bees as she saw first leave the hive fly from the hive and leave in the next 6 hours. Then every bee that left before that hadn't already returned returns to the hive in the next 6 hours. How many bees did Debra see return to the hive in the last 6 hours of the day?

Reasoning + Answer:

<think>

Debra sees 30 bees leave the hive in the first 6 hours .

Then she sees 1 / 2 of 30 , or 15 bees return in the next 6 hours .

Then she sees 2 times the amount of bees that left initially leave , which is 2 * 30 = 60 .

But some of those 60 bees return , some of the first 30 have returned , but some that haven 't returned yet return for the final time .

First the amount of total that have not returned is 30 + 60 = 90 total bees have not yet returned .

60 of those have already returned by that time .

That leave 's 90 - 60 = 30 would not have yet .

The first 15 from 30 have already returned by that time , Which leaves 90 total before that time , but more do return so leave to only the first 15 of those that would not have been the last to return leaving 30 never to return and they leave

30 of those that have not finally are among the ones that just left by this time .

We double the number of the bees left for the second set of the last 6 that left returning the last amount amongst themselves so there are a total of last first return amongst those remaining leaving none that need the second time that fall amongst this last additional first set

Therefore 30 bees will have had that last figure chosen that is returned .
