

Question:

Lisa is part of a choir that has 52 members, 50% of which are boys and 50% of which are girls. The choir decides to perform with just its female members. On the day of the performance, however, half the people performing can't make it to the show because their bus breaks down. The choir's 3 teachers then decide to sing with them. How many people sang in the performance?

Reasoning + Answer:

<think>

The choir has 52 members 50% of which are girls .

$52 * 0.5 = 26$ girls

All the girls would sing .

The bus breaks down and half the people can't go so that means half of 26 can't go .

$26 / 2 = 13$ can't go

That means $26 - 13 = 13$ will still go

There are also 3 teachers

There are 13 people that can perform in the first and 3 teachers .

So there are $13 + 3 = 16$ people in the performance
