

Question:

Nine of the kids in Gina's class are allergic to dairy, 6 are allergic to peanuts and 3 are allergic to both. If there are 32 kids in her class, how many aren't allergic to anything?

Reasoning + Answer:

<think>

There are 9 kids allergic to dairy .

6 kids are allergic to peanuts .

3 are allergic to both .

There are 32 kids in total .

If $9 + 6 = 15$ are allergic to either one or the other ,

and 3 of those are double counted ,

$15 - 3 = 12$ kids are allergic to some nuts

and/or dairy .

So there are $32 - 12 = 20$ who aren't allergic

to anything .

</think>

<answer>

There are 20 kids who aren't allergic .

</answer>
