

Question:

James decides to run 3 sprints 3 times a week. He runs 60 meters each sprint. How many total meters does he run a week?

Reasoning + Answer:

<think>
James decides to run 3 sprints 3 times a week
So , first I will multiply the number of sprints he runs in a day which is 3
So , total sprints in a week will be $3 * 3 = 9$ sprints
Now , he runs 60 meters in each sprint
So , to find the total distance he runs in a week , I will multiply the total sprints in a week with the distance he runs in each sprint
Total distance = $9 * 60$
Total distance = 540
So , James runs 540 meters a week
</think> <answer> 540 </answer>
