

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>
Wendi is giving each of her 20 chickens 3 cups of feed
So, total feed given per chicken will be 3
Total number of chickens is 20
So, total feed given to all chickens per day will be $3 * 20 = 60$ cups
She has already given them 15 cups in the morning
And she has given them another 25 cups in the afternoon
Total feed given so far is $15 + 25 = 40$ cups
Now, to find out the feed needed for the final meal
She needs to subtract the feed already given from the total
So, feed needed for the final meal will be $60 - 40 = 20$ cups
Therefore, Wendi needs 20 cups of feed for the final meal of the day </think> <answer>20</
answer>
