

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think>
Kylar wants to buy 16 glasses
Now , for first glass the price is \$ 5
But for second glass price is 60 % of \$ 5 so , price of second glass will be $(60 / 100) * 5 = \$ 3$
So , for 2 glasses he has to pay $(5 + 3) = \$ 8$
Now , he is buying 16 glasses
So , number of glasses in pairs will be $16 / 2 = 8$
So , total price for 16 glasses will be price for 8 pairs which is $8 * 8 = \$ 64$
So , Kylar needs to pay 64 dollars for 16 glasses
</think> <answer> 64 </answer>
