

Question:

A new program had 60 downloads in the first month. The number of downloads in the second month was three times as many as the downloads in the first month, but then reduced by 30% in the third month. How many downloads did the program have total over the three months?

Reasoning + Answer:

<think>
Downloads in the first month is given as 60
So, downloads in the second month is three times as many as the downloads in the first month
So, downloads in the second month will be $3 * 60 = 180$
Now, downloads in the third month reduced by 30 % of second month's downloads
So, reductions in third month will be 30 % of 180 which is $(30 / 100) * 180 = 54$
So, downloads in the third month will be $180 - 54 = 126$
Total downloads over the three months will be sum of downloads in all three months
So, total downloads = Downloads in first month + Downloads in second month + Downloads in third month
Total downloads = $60 + 180 + 126$
Total downloads = 366
So, total downloads over the three months is 366
</think> <answer> 366 </answer>
