

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>

Wendi is feeding each of her 20 chickens 3 cups of feed

So , total feed one chicken will get is 3

Now , she is giving morning feed so total feed for 20 chickens will be $3 * 20 = 60$ cups

In the afternoon , she is giving another 25 cups of feed

So , total feed given to chickens so far is $60 + 25 = 85$ cups

Now , she needs to find out the feed for the final meal

Number of chickens is 20

Each chicken is getting 3 cups of feed

So , total feed required for 20 chickens will be $3 * 20 = 60$ cups

Therefore , Wendi needs to give 60 cups of feed to her chickens in the final meal of the day </think>

<answer> 60 </answer>
