

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think>

Kylar wants to buy 16 glasses

Now , he has to calculate the cost of first 15 glasses which are normal and cost \$5 each

So , cost of 15 glasses = $15 * 5 = 75$

Next , he is buying 1 glass which costs 60 % of \$ 5

So , cost of 1 glass = $60 / 100 * 5 = 3$

Now , he has to add cost of 15 glasses and 1 glass

Total cost = Cost of 15 glasses + Cost of 1 glass

Total cost = $75 + 3 = 78$

So , Kylar needs to pay 78 dollars for 16 glasses

</think> <answer> 78 </answer>
