

Question:
A new program had 60 downloads in the first month. The number of downloads in the second month was three times as many as the downloads in the first month, but then reduced by 30% in the third month. How many downloads did the program have total over the three months?

Reasoning + Answer:

<think>

Downloads in the first month was 60

Now , number of downloads in the second month is three times as many as the downloads in the first month

So , downloads in the second month will be $3 * 60 = 180$

Now , it is given that number of downloads in the third month reduced by 30 % from second month

So , downloads in the third month will be 60 % of 180 which is $(30 / 100) * 180 = 54$

Now , to find total downloads over three months , I will add downloads of all three months

So , total downloads = Downloads in the first month + Downloads in the second month + Downloads in the third month

Total downloads = $60 + 180 + 54$

Total downloads = 294

So , total downloads over three months is 294

</think> < answer > 294 </answer>
