

Question:

A new program had 60 downloads in the first month. The number of downloads in the second month was three times as many as the downloads in the first month, but then reduced by 30% in the third month. How many downloads did the program have total over the three months?

Reasoning + Answer:

<think>
First, I find out total downloads in second month,
If first month downloads are 60, then second month downloads will be 3 times 60,
So, second month downloads = $3 * 60 = 180$,
Now, third month downloads will be 30% less than second month,
So, third month downloads = $180 - 30\% \text{ of } 180$,
 $30\% \text{ of } 180 = (30 / 100) * 180 = 54$,
So, third month downloads = $180 - 54 = 126$,
Now, to find the total downloads over three months, I will add the downloads of all three months,
Total downloads = $60 + 180 + 126 = 366$,
</think> <answer>366 </answer>
