

Question:

James decides to run 3 sprints 3 times a week. He runs 60 meters each sprint. How many total meters does he run a week?

Reasoning + Answer:

<think>

To find the total number of meters James runs in a week, we need to first determine the total number of meters he runs in a single sprint. Since he runs 60 meters for each sprint and he does 3 sprints a week, we can calculate the total meters ran in a week by multiplying the number of sprints by the distance of each sprint: $3 \text{ sprints} * 60 \text{ meters/sprint} = 180 \text{ meters}$. Since he does this 3 times a week, we then multiply the total meters ran in a single week by the number of times he runs per week: $180 \text{ meters} * 3 = 540 \text{ meters}$.

</think><answer>540</answer>
