

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>
To determine the total amount of feed Wendi needs to give to all the chickens in the final meal , we first need to calculate the total amount of feed she has given so far . In the morning , she gave 15 cups of feed , and in the afternoon , she gave 25 cups . The total amount of feed given so far is $15 + 25 = 40$ cups . Since Wendi has 20 chickens and each chicken gets 3 cups of feed , the total amount of feed needed for the entire flock is $20 * 3 = 60$ cups . To find out how much feed is needed for the final meal , we subtract the amount already given from the total need : $60 - 40 = 20$ cups .
</think><answer>20</answer>
