

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think>

To find the total cost of the glasses Kylar wants to buy, we need to calculate the cost of the glasses that are full price and the cost of the glasses that are discounted. Since Kylar is buying 16 glasses, 8 of them will be full price at \$5 each, and 8 of them will be at 60% of the price. First, we calculate the cost of the full-price glasses: $8 * \$5 = \40 . Then, we calculate the cost of the discounted glasses: $8 * 60\% \text{ of } \$5 = 8 * 0.6 * \$5 = \$24$. Finally, we add the cost of the full-price glasses and the discounted glasses to get the total cost: $\$40 + \$24 = \$64$.

</think><answer>64</answer>
