

Question:

Josh decides to try flipping a house. He buys a house for \$80,000 and then puts in \$50,000 in repairs. This increased the value of the house by 150%. How much profit did he make?

Reasoning + Answer:

<think>

To determine Josh's profit, we need to first calculate the new value of the house after the repairs. The original price of the house was \$80,000, and the repairs cost \$50,000, so the new value of the house is $\$80,000 + \$50,000 = \$130,000$. Since the value of the house increased by 150%, we can calculate the original value of the house before the repairs by dividing the new value by 2.5 ($1 + 150\% = 250\%$, or $1/1.5 = 2/3$, so $130,000 / 2.5 = 52,000$). So the original value of the house was \$52,000. To find the profit, we subtract the original purchase price from the new value: $\$130,000 - \$80,000 = \$50,000$.

</think><answer>50000</answer>
