

Question:

James decides to run 3 sprints 3 times a week. He runs 60 meters each sprint. How many total meters does he run a week?

Reasoning + Answer:

<think>

To find the total distance James runs in a week, we need to first determine the total distance he runs in a single sprint. Since he runs 60 meters for each sprint, and he does 3 sprints a week, we can calculate the total distance per week by multiplying the distance of a single sprint by the number of sprints per week: $60 \text{ meters} * 3 = 180 \text{ meters}$. Since this is the distance he runs in a week, we can conclude that James runs 180 meters a week.

</think><answer> 180 </answer>
