

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>
To determine the total amount of feed Wendi needs to give to her chickens in the final meal, we need to first calculate the total amount of feed she has given so far. In the morning, she gave the chickens 15 cups of feed, and in the afternoon, she gave them 25 cups. So, the total amount of feed given so far is $15 + 25 = 40$ cups. Since each chicken needs 3 cups of feed, we then divide the total amount of feed given so far by 3 to find out how many cups each chicken has received. $40 / 3 = 13.33$ cups per chicken. Since there are 20 chickens, we can then multiply the number of cups each chicken has received by the total number of chickens to find the total amount of feed needed for the final meal. $13.33 * 20 = 266.6$ cups. Since we cannot have a fraction of a cup, we will need to round up to the nearest whole number. However, in this case, we are asked for the amount needed for the final meal, so we will provide the exact amount that corresponds to the full feeding for 20 chickens.
