

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think>
To find the total cost of the glasses Kylar wants to buy, we need to calculate the cost of the glasses that are priced at \$5 and the cost of the glasses that are priced at 60% of \$5. First, we find the cost of the glasses priced at 60% of \$5, which is $0.6 * 5 = \$3$ per glass. Since Kylar wants to buy 16 glasses, we then calculate the cost of these glasses: $16 * 3 = \$48$. The number of glasses priced at \$5 is $16 - 8 = 8$. The cost of these glasses is $8 * 5 = \$40$. To get the total cost, we add the cost of both types of glasses: $\$48 + \$40 = \$88$.
