

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>she gave 15 in morning .so its $3 * 15 = 45$ cups in the morning
she gave 25 in afternoon .so its $3 * 25 = 75$ cups in the afternoon
she gave 45 in morning and 75 in afternoon .so its $45 + 75 = 120$ cups in morning
and afternoon
she has 20 chickens .so she gives 3 cups to each = $3 * 20 = 60$ cups in a day
she has already given 120 so it is $60 - 120 = -60$
so she needs -60 cups = 60 cups
she needs 60 cups of feed in the final meal of the day.
