

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>the total number of cups of feed given in the morning is 15, and in the afternoon is 25, so the total number of cups of feed given in the morning and afternoon is $15 + 25 = 40$, Wendi has a flock of 20 chickens, and each chicken is given 3 cups of feed, so the total number of cups of feed needed for the whole flock is $20 * 3 = 60$, to find the number of cups of feed needed for the final meal, we subtract the total number of cups of feed given in the morning and afternoon from the total number of cups of feed needed for the whole flock, so the number of cups of feed needed for the final meal is $60 - 40 = 20$

</think> <answer>20</answer>
