

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think> the cost of one glass is 5 dollars , but every second glass costs 60 % of the price of the first glass , so the cost of the second glass is $5 * 60 \% = 3$ dollars , Kylar wants to buy 16 glasses , so the number of second glasses he will buy is $16 / 2 = 8$, and the number of first glasses he will buy is also 8 , so the total cost of the first glasses is $8 * 5 = 40$ dollars , and the total cost of the second glasses is $8 * 3 = 24$ dollars , so the total cost of 16 glasses is $40 + 24 = 64$ dollars </think> <answer> 64 </answer>
