

Question:

Carla is downloading a 200 GB file. Normally she can download 2 GB/minute, but 40% of the way through the download, Windows forces a restart to install updates, which takes 20 minutes. Then Carla has to restart the download from the beginning. How long does it take to download the file?

Reasoning + Answer:

<think> carla is downloading a 200 GB file , and she can download 2 GB / minute , so the time it takes to download the whole file is $200 / 2 = 100$ minutes , but 40 % of the way through the download , windows forces a restart , so she has downloaded 40 % of 200 GB , which is 80 GB , and the remaining file size is $200 - 80 = 120$ GB , after the restart , she has to download the whole 120 GB again , and she can download 2 GB / minute , so the time it takes to download 120 GB is $120 / 2 = 60$ minutes , so the total time it takes to download the file is the initial 100 minutes plus the time taken to download the remaining 60 minutes , so the total time is $100 + 60 = 160$ minutes </think> <answer> 160 </answer> >
