

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think> the total number of cups of feed given to the chickens in the morning is 15 , and in the afternoon is 25 , so the total number of cups of feed given in the morning and afternoon is $15 + 25 = 40$, since the chickens are given 3 cups of feed in each meal , the total number of meals in a day is 3 , so the total number of cups of feed given to all the chickens in a day is 3 times the total number of cups of feed given in the morning and afternoon , which is $3 * 40 = 120$, and the size of Wendi's flock is 20 chickens , so the total number of cups of feed needed for all the chickens in the final meal of the day is the total number of cups of feed given in a day minus the total number of cups of feed given in the morning and afternoon , which is $120 - 40 = 80$ </think> <answer> 80 </answer>
