

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think> the cost of one glass is 5 dollars, but every second glass costs only 60% of the price, so the cost of the second glass is $5 * 60 / 100 = 3$ dollars, Kylar wants to buy 16 glasses, so the number of first class glass items is 8, and the numbers of the second one is 8, so in total he pays $5 * 8 + 3 * 8 = 40$
</think> <answer> 40 </answer>
