

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think first the cost of one glass is \$ 5 , and the cost of every second glass is 60 % of \$ 5 , so the cost of the second glass is $5 * 0.6 = \$ 3$, now we have two prices for glasses , one is \$ 5 and the other is \$ 3 , and he is buying 16 glasses , so the number of glasses of price \$ 5 is 8 (as 16 is even) and the number of glasses of price \$ 3 is also 8 , so the total cost is $(8 * 5) + (8 * 3) = 40 + 24 = 64$ </think><answer> 64 </answer>
