

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think the total number of cups of feed given in the morning and afternoon is $15 + 25 = 40$, and the total number of meals is 3, so the total number of cups of feed for all the meals is $3 * 3 = 9$, so the number of cups of feed in the final meal is $40 - 9 = 31$ </think><answer>31 </answer>
