

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think first we have 16 glasses, so 15 of them will be the one that costs 5 dollars, so the cost of those 15 glasses is $15 * 5 = 75$, now the remaining one glass will cost 60% of 5, so the cost of that glass is $5 * 0.6 = 3$, so the total cost is $75 + 3 = 78$ </think><answer>78</answer>
