

Question:

While at the dollar store, Sloane counts 100 customers entering the store. The next day, she counts 50 more customers than the first day. If the total number of customers by the third day was 500, how many customers did she count on the third day?

Reasoning + Answer:

100 + 50 = 150 enter store on the second day.
150 + 350 = 500 is the total number of customer.
So Sloane counts 500 - 150 = 350 customers on the third day.
350 customers did she count on the third day.
