

Question:

A company bought \$400000 worth of equipment from a retailer business, but pieces of equipment worth 40% of the total number were faulty. If they returned the faulty pieces of equipment to the seller, calculate the total amount of money spent on functioning pieces of equipment.

Reasoning + Answer:

let x be the number of pieces of equipment then $0.6x = 4000000$
 $0.6x = 4000000$
 $x = \frac{4000000}{0.6} = 6666666.67$
then total cost of the equipments = $6666666.67 * 4000000$
 $= 26666666680$
