

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think so first you need to find out the total amount of feed given in the morning and afternoon .

so you do 15 + 25 for that .

so 15 + 25 = 40 .

so she gave 40 cups of feed in the morning and afternoon .

now since she has 20 chickens and she feeds each 3 cups .

so you do 20 * 3 because she feeds each 3 cups .

so 20 * 3 = 60 .

so now she needs 60 cups for all the chickens .

so now u need to find the difference between the 60 and 40 cause she gave 40 in the morning and afternoon .

so 60 - 40 .

60 - 40 = 20 .

so the answer is 20 .

so she needs 20 cups for the final meal . so i put it in the answer format .

so i say the answer is 20 cups . so i 'll put that as .

so she needs 20 cups of feed in the final meal . so i 'll write it down .

so the answer is 20 . so i put the quote for the answer .

so answer is < answer > 20 </answer >
