

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think so first you need to find out the total amount of feed for the morning and afternoon .

so you do 15 + 25 for that .

so 15 + 25 = 40 .

so she gave 40 cups of feed in the morning and afternoon .

because she says she gives 3 cups to each chicken .

so now you need to find out how many cups 3 is if she has 20 chickens .

so 3 * 20 .

3 * 20 = 60 .

so now we know that each chicken gets 60 cups in total .

so since she has 20 chickens and she gave 40 in the morning and afternoon .

so we do 60 * 20 cause she has 20 chickens .

so 60 * 20 = 1200 .

so the answer is 1200 cups . so i did 3 * 20 cause she give 3 cups to each chicken and she has 20 chickens . then i did 60 * 20 beca u we she has 20 chickens . so the answer is 1200 .

so i think the teacher might have meant per chicken instead of for the whole day so the answer is 1200 .

so i 'll do think again .

since she gives 3 cups to each chicken and she has 20 chickens .

so 3 * 20 = 60 .

this is the amount of feed per chicken .

so now we know she needs 60 cups of feed per chicken .

and we know she has 20 chickens .

so to find out the total cups of feed we do 60 * 20 .

60 * 20 = 1200 .

so the answer is 1200 . so i did 3 * 20 again because she give 3 cups to each chicken and she has 20 chickens . then i did 60 * 20 beca u we she has 20 chickens . so the answer is 1200 .

so the answer is 1200 cups .
