

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>
The total amount of feed given in the morning and afternoon is $15 + 25 = 40$ cups
 Since Wendi has a flock of 20 chickens, the feed given per chicken in the morning and afternoon is $40 \div 20 = 2$ cups per chicken
 So, for the final meal, she needs to give each of her 20 chickens $3 - 2 = 1$ cup of feed
 Therefore, she needs $20 \times 1 = 20$ cups of feed for the final meal
 </think><answer>20</answer>
