

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think>

The cost of the first glass is \$5
 The cost of every second glass is $5 \times 60\% = 3$ dollars
 So , for 16 glasses , Kylar needs to buy 8 glasses at 5 dollars each and 8 glasses at 3 dollars each
 The total cost for 8 glasses at 5 dollars each is $8 \times 5 = 40$ dollars
 The total cost for 8 glasses at 3 dollars each is $8 \times 3 = 24$ dollars
 So , Kylar needs to pay $40 + 24 = 64$ dollars
 </think>

><answer> 64 </answer>
