

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think>
The cost of the first glass is 5 dollars
 The cost of the second glass is $5 \times 60\% = 3$ dollars

So, for every 2 glasses, Kylar needs to pay $5 + 3 = 8$ dollars
 Since Kylar wants to buy 16
glasses, which is 8 pairs of glasses, he needs to pay $8 \times 16 = 128$ dollars
 </think><answer>
128</answer>
