

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

`<think>`
Wendi gives her flock of chickens 15 cups in the morning and 25 cups in the afternoon, so the total amount of feed given in the morning and afternoon is:
`\[15+25=40\text{ cups}\]`

Since the size of Wendi's flock is 20 chickens, and she feeds each chicken three cups of feed per day, the total amount of feed needed for one chicken for the whole day is:
`\[3\times 1=3\text{ cups}\]`

Therefore, for 20 chickens, the total amount of feed needed for the whole day is:
`\[20\times 3=60\text{ cups}\]`

Thus, the amount of feed she needs to give her chickens in the final meal of the day is:
`\[60-40=20\text{ cups}\]`
`</think>`
`<answer>20</answer>`
