

**Question:**

James decides to run 3 sprints 3 times a week. He runs 60 meters each sprint. How many total meters does he run a week?

**Reasoning + Answer:**

<think>

James runs 3 sprints each time he exercises :

So , the distance he runs in one exercise is :

$$\text{[ 3 \times 60 = 180 \text{ { meters } } ]}$$

Since he runs 3 sprints 3 times a week , the number of exercises he does in a week is :

$$\text{[ 3 \times 3 = 9 \text{ { exercises } } ]}$$

Thus , the total distance he runs in a week is :

$$\text{[ 9 \times 180 = 1620 \text{ { meters } } ]}$$

<answer> 1620 </answer>
