

Question:

Josh decides to try flipping a house. He buys a house for \$80,000 and then puts in \$50,000 in repairs. This increased the value of the house by 150%. How much profit did he make?

Reasoning + Answer:

<think> To solve this problem , let's first calculate the new value of the house after Josh made the repairs and increased its value by 150%. Since the original value of the house was \$80,000 and it increased by 150%, we need to first find out what 150% of \$80,000 is . Let's denote the original value of the house as (V) , which is \$80,000 . To find 150% of (V) , we can use the formula : $(150\% \times V = 1.5 \times V)$. So , we calculate $(1.5 \times 80,000)$ to find the increase in value .

Let's perform this calculation : $(1.5 \times 80,000 = 120,000)$. This means the increase in value is \$120,000 .

Next , we need to add this increase to the original value of the house to find the new total value : $(80,000 + 120,000 = 200,000)$. So , the new value of the house after the increase is \$200,000 .

Now , we know that Josh bought the house for \$80,000 and put in \$50,000 in repairs . To find the total cost Josh incurred , we add the original price of the house to the cost of the repairs : $(80,000 + 50,000 = 130,000)$.

Finally , to find out how much profit Josh made , we subtract the total cost from the new value of the house : $(200,000 - 130,000 = 70,000)$. </think>

<answer>70000 </answer>
