

Question:

Janet’s ducks lay 16 eggs per day. She eats three for breakfast every morning and bakes muffins for her friends every day with four. She sells the remainder at the farmers' market daily for \$2 per fresh duck egg. How much in dollars does she make every day at the farmers' market?

Reasoning + Answer:

<think> To solve this problem , let's first determine the total number of eggs laid by Janet's ducks per day . According to the problem , the ducks lay 16 eggs per day .

Next , we need to account for the eggs Janet eats for breakfast . It's stated that she eats 3 eggs for breakfast each morning . So , we subtract the 3 eggs eaten from the total daily egg production : $(16 - 3 = 13)$ eggs remaining after breakfast .

Now , we know that Janet bakes muffins with 4 eggs each time . This information is not directly relevant to calculating the revenue from the farmers ' market , but it helps to confirm the consistency of the given data .

Finally , we need to find out how much money Janet makes from selling the remaining eggs at the farmers ' market . The problem states that she sells the remainder at \$2 per egg . Since we determined there are 13 eggs left after breakfast , we can now multiply this number by 2 to find her daily earnings : $(13 \times 2 = 26)$. </think>

<answer> 26 </answer>
