

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think>

He wants to buy 16 glasses so $16 / 2 = 8$ pairs of glasses

One glass costs \$5 so $8 \text{ pairs} \times 5 = \40

Every second glass costs 60% of the price so $5 \times 60 / 100 = 3$

He bought 8 pairs of second glasses so $8 \times 3 = \$24$

Altogether he need to pay $40 + 24 = \$64$

</think>

<answer> 64 </answer>
