

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think>
He wants to buy 16 glasses so $16 / 2 = 8$ sets of two glasses
One glass cost \$5 so $8 \times 5 = \$40$ for 8 sets of two glasses
The second glass costs 60% of the price so $5 \times 0.6 = 3$ dollars
For one set of two glasses cost $5 + 3 = 8$ dollars
For 8 sets of two glasses cost $8 \times 8 = 64$ dollars
He need to pay $40 + 64 = 104$ dollars
</think>
<answer> 104 </answer>
