

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

Let's solve this problem step-by-step:

<think>

1st, 3rd, 5th... are \$5

2nd, 4th, 6th... are 60% of \$5 = \$3

There are $16 \div 2 = 8$ glasses at each price

$8 \times 5 = \$40$ for 1st, 3rd, 5th...

$8 \times 3 = \$24$ for 2nd, 4th, 6th...

Total = $40 + 24 = \$64$

</think><answer>64</answer>
