

Question:

Josh decides to try flipping a house. He buys a house for \$80,000 and then puts in \$50,000 in repairs. This increased the value of the house by 150%. How much profit did he make?

Reasoning + Answer:

<think> First let's calculate the new value of the house after the repairs . Initially the house was worth 80 000 dollars . After the repairs . The value of the house increased by 150 % . To calculate the increased value . 150 % of 80 000 dollars can be calculated as $150 / 100 * 80 000 = 120 000$ dollars . Therefore after the repairs the house's value increased by 120 000 dollars . Adding the initial value and the increased value . $80 000 + 120 000 = 200 000$ dollars . Now the new value of the house is 200 000 dollars . Next let's calculate the total cost of the house including the purchase price and the repairs . The purchase price of the house was 80 000 dollars . Additionally 50 000 dollars were spent on repairs . Therefore $80 000 + 50 000 = 130 000$ dollars were spent in total . Finally to calculate the profit . The selling price of the house is 200 000 dollars . The total cost of the house is 130 000 dollars . Therefore the profit made by Josh is $200 000 - 130 000 = 70 000$ dollars . Therefore Josh made a profit of 70 000 dollars . </think><answer>70 000</answer>
