

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think> First let's calculate how much feed each chicken eats in total . Each chicken eats 3 cups of feed per day . Since Wendi has 20 chickens . In total the chickens eat $3 * 20 = 60$ cups of feed per day . Now let's calculate how much feed has already been given . In the morning Wendi gives 15 cups of feed . In the afternoon 25 cups of feed . In total she has given $15 + 25 = 40$ cups of feed . To find out how much feed she needs to give in the final meal . We subtract the amount of feed already given from the total amount of feed . $60 - 40 = 20$ cups of feed . Therefore Wendi needs to give 20 cups of feed in the final meal . </think><answer> 20 </answer>
