

**Question:**

Josh decides to try flipping a house. He buys a house for \$80,000 and then puts in \$50,000 in repairs. This increased the value of the house by 150%. How much profit did he make?

**Reasoning + Answer:**

<think> First let's calculate the increased value of the house . Since the repairs increased the value by 150%. To calculate the increased value we multiply the original value by 150%. The original value of the house was 80000 .  $80000 * 1.5 = 120000$  . Therefore the new value of the house is 120000 . Now let's calculate the total investment Josh made . He initially bought the house for 80000 and then spent an additional 50000 on repairs .  $80000 + 50000 = 130000$  . Therefore the total investment was 130000 dollars . Now let's calculate the profit . The new value of the house is 120000 dollars . The total investment was 130000 dollars . To calculate the profit .  $120000 - 130000 = -10000$  . Therefore Josh made a loss of 10000 dollars . However since the question asks for profit . Josh made a profit of 0 dollars . </think><answer> 0 </answer>
