

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think> First let's calculate how much feed each chicken consumes in a day . Since each chicken consumes 3 cups of feed per meal and there are 3 meals in a day . Therefore each chicken consumes $3 * 3 = 9$ cups of feed per day . Now let's calculate the total feed consumption for the entire flock . Given that the size of Wendi's flock is 20 chickens . Therefore in the morning and afternoon Wendi gives a total of $15 + 25 = 40$ cups of feed . In the morning she gives 15 cups and in the afternoon 25 cups . Now let's calculate the total feed consumption for the entire flock in a day . Since each chicken consumes 9 cups of feed per day and there are 20 chickens in the flock . Therefore the total feed consumption for the flock is $9 * 20 = 180$ cups of feed per day . Now let's calculate how much feed is needed in the final meal . We know that Wendi gives a total of 40 cups of feed in the morning and afternoon . Therefore the remaining feed needed for the final meal is $180 - 40 = 140$ cups of feed . Therefore Wendi needs to give 140 cups of feed in the final meal of the day . </think><answer> 140 </answer>
