

Question:

Josh decides to try flipping a house. He buys a house for \$80,000 and then puts in \$50,000 in repairs. This increased the value of the house by 150%. How much profit did he make?

Reasoning + Answer:

<think>
we know josh bought the house for 80 thousand dollars so we can write that down
so now it says he puts in 50 thousand dollars in repairs so we do the 80 thousand he paid for the house
and then add the 50 thousand in repairs to work out the total cost
so we do 80 thousand plus 50 thousand which equals 130 thousand so now we know the total cost is 130 thousand dollars
then the question says the house increased in value by 150 percent because of the repairs so to work out the new value we take the original cost of the house which was 80 thousand and work out 150 percent of that
to work out 150 percent of 80 thousand we do 80 thousand times by 150 percent which is the same as times ing by 150 and then dividing by 100 so we do 80 thousand times 150 then divide by 100 which equals 120 thousand
so now we know the repairs increased the value of the house by 120 thousand
so now to work out the new value of the house we take the original cost of 80 thousand and add the 120 thousand from the repairs so 80 thousand plus 120 thousand which equals 200 thousand
so now we know the new value of the house is 200 thousand dollars
so now to work out josh's profit we take the total cost which we worked out was 130 thousand and take that from the new value of the house which we worked out was 200 thousand
so we do 200 thousand take away 130 thousand which equals 70 thousand
</think><answer>70000</answer>
