

Question:

James decides to run 3 sprints 3 times a week. He runs 60 meters each sprint. How many total meters does he run a week?

Reasoning + Answer:

<think>
we know james does 3 sprints every time he runs
so we can first work out how many sprints he does in total in one week by doing the 3 sprints he does
each time and then multiplying that by however many times a week he does it so we do 3 sprints
times 3 times a week which we do like this : 3 sprints * 3 times a week = 9 sprints a week
then we know each sprint is 60 meters so now we know the total number of sprints a week and we
know how long each sprint is so now we can do the total number of sprints a week which we now know
is 9 and times that by the 60 meters each sprint is
so we take the 9 sprints a week and times that by the 60 meters each sprint is so we do 9 sprints * 60
meters
so we do the sum 9 * 60 which equals 540
so now we know james runs 540 meters in total a week
</think><answer>540</answer>
