

Question:

James decides to run 3 sprints 3 times a week. He runs 60 meters each sprint. How many total meters does he run a week?

Reasoning + Answer:

<think>
we know james does his sprints 3 times a week so we can write that down
so now we know he does his sprints 3 times a week
then we know each sprint is 60 metres so we can do a bit of maths to work out how many metres he
does in total
so we take the 3 sprints he does a week and the 60 metres in each sprint and do them together
so we take the 3 sprints and the 60 metres per sprint and do 3 times 60
3 times 60 equals 180
so now we know he does 180 metres in total a week
</think><answer>180</answer>
