

Question:

DNA replication is a highly complex process where replication occurs on both strands of DNA. On the leading strand of DNA, replication occurs uninterrupted, but on the lagging strand, replication is interrupted and occurs in fragments called Okazaki fragments. These fragments need to be joined, which of the following enzymes is involved in the penultimate step before ligation can occur?

Answer Choices:

- A. DNA gyrase
- B. DNA helicase
- C. DNA polymerase I
- D. DNA polymerase III

Reasoning + Answer:

<answer> D . DNA polymerase I </answer>
